ABSTRACT

The 2019-nCoV outbreak globally and became world pandemic. The present virus is a new strain of corona virus that is causing an outbreak of serious respiratory problem. As the modified strain of virus is new the research on various aspect like pathogenesis, prognosis, etc are limited due to lack of time and rapidly spreading. The best measure in prevention by maintaining social distancing and other hygienic measures. The present article highlights different aspects of current virus and its symptomatic treatment and also the concept of prevention by social distancing and isolation of patient as well as suspected individual. The article also highlights the art of living with the virus by adopting different measures inside home and at public places, as the virus will sustain and create health hazard until the advent of an effective vaccine. The social discipline and awareness amongst people of South Korea minimize the number of cases and health hazard related to the pandemic.
